

## VIAFIX: Joint Failure Repair

Joint failure located within the wheel track on a T-junction turning point – A tricky situation for standard hot or cold lay asphalts, but nothing **Viafix** can't handle! No saw cut or traffic management necessary.

Once Viafix is placed in failure / pothole, even under water, it can be trafficked immediately - bad weather only assists with the curing process when using **Viafix**.

Traffic will compact the material for you and will not rut or stick to tyres. The end result is a permanent level repair with good skid resistance.
